Applicant

THE UNIVERSITY OF MANITOBA et al.

- 1. The applicant is hereby notified that this International Preliminary Examining Authority transmits herewith the international preliminary examination report and its annexes, if any, established on the international application.
- 2. A copy of the report and its annexes, if any, is being transmitted to the International Bureau for communication to all the elected Offices.
- 3. Where required by any of the elected Offices, the International Bureau will prepare an English translation of the report (but not of any annexes) and will transmit such translation to those Offices.

### 4. REMINDER

The applicant must enter the national phase before each elected Office by performing certain acts (filing translations and paying national fees) within 30 months from the priority date (or later in some Offices) (Article 39(1)) (see also the reminder sent by the International Bureau with Form PCT/IB/301).

Where a translation of the international application must be furnished to an elected Office, that translation must contain a translation of any annexes to the international preliminary examination report. It is the applicant's responsibility to prepare and furnish such translation directly to each elected Office concerned.

For further details on the applicable time limits and requirements of the elected Offices, see Volume II of the PCT Applicant's Guide.

2. Citations and explanations see separate sheet

### VIII. Certain observations on the international application

The following observations on the clarity of the claims, description, and drawings or on the question whether the claims are fully supported by the description, are made: see separate sheet

### Point V.2. 1).

- 1.1. The present method of claim 10 (and claims 11-17) for measuring the activity or concentration of a bioactive molecule would appear to lack novelty or at least an inventive step regarding D1: EP-A-0 308 704; cf claim 1 and Example 1. In D1 the reactant is also immobilised and a contains a known quantity of the detectable lable (cf. part c of Example 1), a sample is added/incubated and an enzymatic activity is measured after the incubation in a portion of the sample which has been transferred.
- 1.2. The present method of claim 1 (and claims 2-9), claim 10 (and claims 11-17) for measuring the activity or concentration of a bioactive molecule would appear to lack novelty or at least an inventive step regarding D3: WO-A-97/4343438; against present claim 1 (label/indicator with sample) see D3, e.g. claim 28 and also claim 44; against present claim 1 (label/indicator with bound reactant/bound first component) see D3, e.g. claim 15.

#### 2). Point VIII.

- 2.1. The present claims are rendered unclear by the term "quantity" in claims 1 and 10, i.e. by the phrases (claim 1) "removing a quantity of detectable label from the sample by binding detectable label to the reactant coated on the reaction vessel" and "measuring the quantity...counting vessel" and (claim 10) "releasing a quantity of detectable label from the reactant by incubating the reaction vessel under conditions such that the reactant and the detectable label contact the bioactive molecule having biological activity" and "measuring the quantity...counting vessel".
- 2.2. Present claims 1 and 10 would not allow a skilled person to understand the proportionality (which must exist) between an "amount of label" (cf. examples in the description) and the activity/concentration to be measured.

### (54) Title: A METHOD FOR MEASURING BIOMOLECULES

(57) Abstract: Described herein is a method for detecting molecules with biological activity and determining the identity, amount and activity of same. The method involves the use of a vessel-based system which facilitates and simplifies the measurement of the amount and activity of enzymes, enzyme inhibitors, lectins, receptors and other biologically active substances comprising the steps of carrying out a biological reaction in a first vessel and then separating a labeled reactant from a labeled product by transferring a portion of the reaction mixture to a second vessel. Specifically, the surface of the first vessel is coated with a reactant, additional components are added, thereby forming a reaction mix, and the reaction is allowed to proceed for a given period of time. The soluble portion of the reaction mix is then transferred to a second vessel and the amount of reactant liberated into the reaction mix is counted.
